$$\frac{1}{2} f(x) = 2x - e^{-6x} \\
= f'(x) = 6e^{-6x} + 2$$

$$\frac{a}{h} = \frac{1}{2(x+h) - f(x)} = \frac{1}{2(x+h) - e^{-6(x+h)} - 1} - \frac{1}{2x - e^{-6x}} \\

$$\frac{d}{dt} D_{h}^{(1)} = \frac{2}{4} D_{hy_{2}} - D_{h} \qquad (x_{1} = 0.2)$$

$$D_{h} = \frac{f(x+h) - f(x+h)}{2h} \Rightarrow D_{hy_{2}} = \frac{f(x+hy_{2}) - f(x-hy_{2})}{2x(hy_{2})}$$

$$D_{005} = \frac{f(0.2+0.5) - f(0.2-0.5)}{2x0.5} \approx 8.0347$$

$$h = 0.5 \Rightarrow hy_{2} = 0.25$$

$$D_{0.25} = \frac{f(0.2+0.25) - f(0.2-0.25)}{2x0.35} \approx 4.5652$$

$$D_{0.5}^{(1)} = \frac{4 \cdot D_{0.25} - D_{0.5}}{4-1} = 3.4089$$
Actual value at $x_{0} = 0.2 \Rightarrow f'(0.2) = 3.80716527147$

2. During the class, we derived in detail the first order Richardson extrapolated derivative, by using $h \to h/2$,

$$D_h^{(1)} \equiv f'(x_0) - \frac{h^4}{480} f^{(5)}(x_0) + \mathcal{O}(h^6)$$
.

- (a) (4 marks) Using h → h/2, derive the expression for D_h⁽²⁾ which is the second order Richardson extrapolation.
- (b) (5 marks) Now starting from the definition of D_h and using $h \to h/3$, derive the expression for $D_h^{(1)}$.
- (c) (3 marks) Now identify the Error Part of the expression found in the previous part, and also find the Error Bound of the expression found in the previous part.
- (d) (3 marks) If $f(x) = \ln x$, $x_0 = 1$, h = 0.1, find the upper bound of error for $D_h^{(1)}$.
